

Cap Bottom Table Rubber Padding Peeling Solutions

Please do the following:

1. The cap bottom table padding can peel away even when new – that is normal, unfortunately – and you can re-adhere it with high temp RTV silicone adhesive (“gasket maker” in auto parts stores). The key is to CLAMP THE PRESS OVERNIGHT and let the adhesive cure while pressed under pressure.
2. Don’t replace the whole table if the padding is peeling. You can just replace the PAD ONLY (order SRM-3847 from www.heatpress.com/support - that’s all - peel and stick & clamp overnight).
3. If the loading and unloading of caps is pulling and tugging on the padding, that will peel up on the pad. **Many customers wrap 100% plain polyester fabric around the bottom table and neatly/discreetly DUCT Tape the fabric to the underside of the bottom table, out-of-sight.** This way the cap is not pulling and yanking directly on the sticky rubber padding, but gliding on and off the bottom table smoothly because of the fabric. Then – the padding lasts forever!
