

# Programming Digital Knight Presses

Programmable presets are stored programs where commonly used Temperature, Time and Height (pressure) settings can be stored and retrieved.

Presets can be recalled simply by pressing the PRG key, selecting the program desired with the arrow keys, and pressing the PRG key again. This will update the current settings on the press with the settings in the preset.

Presets can be edited by pressing the TEMP key while inside the programs. When the display shows "SEt", press the TEMP key to change the temperature, time and PRS (height) settings for that preset. The TEMP key moves the flashing value from Temp to Time to PRS and back to "SEt". The arrow keys change the value.

.....

So... the PRG key enters into the presets, and also exits the presets. When exiting the presets, the press temperature & time is updated with the values that were stored in the preset, and the PRS display tells the operator what height level to adjust the pressure to.
