

Pressure & Flatness Check

1. Please check the flatness of the bottom rubber padding. Take a 2ft long straight edge and gently rest it on the pad, front-to-back along the 20" dimension, down the middle. Any daylight, gaps, spaces? It should be pretty flat and gapless.
2. Do the same on the top heat platen, holding the straight edge against the top heating surface. There should be about a dime's space or less. NOT a nickel!
3. Please send me a 5 to 10 second short Small VIDEO clip of the press being **closed** and **locked**, and **popping back open**. From the **side view**. Make sure I see the **whole press** and the **operator's arms** locking it. Then I'll know how it's closing and locking and opening. Set the timer for like 4 seconds or something.
